COSC2471 Assessment 2

AI Bounded Process use declaration

Required for iPSE Assessment 2- if you do not fill this, the assessment will not be marked. Complete this template, export it as a PDF, and submit the PDF.

This document allows your marker to judge your authorship, your decision-making, and the quality of your critical engagement with AI. It is not used to reward AI use. It is used to assess whether you remained the author and final decision-maker. A concise, honest, and specific account is more useful than a long but vague one.

Part A: Student Details

Student Numbers & Names: S4084278/Nina Chen, s4015017 / Hengly Lim

AI bounded process allowed in this assessment: Parts A & B

Date submitted: 11/10/2026

Part B: Account of AI Use

Complete all five fields below for each AI tool you used. If you used more than one tool for different purposes, copy this section for each. ***Expand the answer boxes to add more lines, as needed****.*

We have used AI for surface-level support. Here are the details of our use.

1. Tool used:

Name of the AI tool and version if known — e.g., ChatGPT, GPT-4, Microsoft Copilot, Gemini 1.5

ChatGPT (OpenAI, GPT-6). Claude Sonnet 5.5

2. Purpose of use:

What specific process task were you allowed to use this tool for? e.g., brainstorming section headings, generating alternative code approaches, receiving feedback on my argument structure, obtaining debugging hints

Nina: I used ChatGPT for debugging Swift compilation errors. During development, I encountered compilation errors such as “Main actor-isolated default value in a nonisolated context”, “Value of type x has no member Date”. I let ChatGPT explained the error and possible solution to it.

Lee: I used Claude for help generate some idea for gestures for me to implement alongside my idea of having double tap to zoom in,

3. What the AI produced:

Briefly describe the output the AI gave you. e.g. A list of five possible section headings / Three alternative function implementations / Written feedback on two paragraphs / A hint about the bug location

Nina: ChatGPT provided explanations of compilation errors and suggested code corrections.

Lee: Claude suggested double tap to switch between Zoom and panning,

4. What I did with that output:

Describe what you accepted, rejected, revised, or rewrote — and why. e.g. I rejected two suggestions as irrelevant to the brief. I significantly revised one heading to better match my argument. I rewrote the function logic independently after seeing the AI version.

Nina: I used the explanation to understand the compilation errors.

Lee; I went against it due to our timeline view already have button in the footer for that functionality,

5. How it influenced the final submission:

Which specific section or stage of the submission was affected, and to what extent? e.g., AI influenced the section headings in Part 2, but the content under each heading is entirely my own. The final decisions, interpretation, and submitted work are mine.

AI assistance contributed to debugging, code refinement, and the implementation of the featured figures carousel. It helped me understand framework interoperability and resolve integration problems more efficiently. The final application was integrated and tested within our existing project, with implementation decisions guided by the assignment requirements.

ChatGPT supported our technical understanding and debugging process. The final application code was written and integrated by the team, using the knowledge gained from these explanations

Claude did suggest some addition funationality for my double taps gestures of instead of just limited to revert the view back to default, when you double taps on an entry, the timeline would make that entry zoomed into fill in the width of the screen.

Part C: Declaration

Select all that apply and sign below.

☐ We did not use any AI tool in the preparation or submission of this assessment.

or

☒ We used AI only for the process purposes explicitly permitted in the task instructions.

☒ We remained the authors and final decision-makers throughout this assessment.

☒ The account we have provided above accurately and honestly describes how we used AI in this task.

☒ We take responsibility for the quality, accuracy, integrity, and final form of the submission.

☒ We understand that my assessor may ask me to explain or discuss my work and my AI use, and that we are expected to be able to do so without reference to AI-generated material.

☒ We understand that using AI beyond the permitted scope or failing to declare AI use where required may result in a mark reduction or referral for academic integrity review.

Signature: Nina Chen, Hengly Lim

Date: 10/10/2026

This document is not used to reward AI use. It is used to judge your authorship, your decision-making, and the quality of your critical engagement. Aim for quality of reflection, not length.
NO SIGNATURE & DATE = NO MARKS FOR ASSESSMENT 2.

Part A Task a

Define your app concept in the report through:

Concept statement

For junior university history students, identifying history figures who lived at the same time across different regions is difficult because it requires multiple separate searches and comparisons. My app makes this easier by allowing users to select a historical figure and automatically discover contemporaries whose lifespans overlap, supported by a shared interactive timeline.

User and context — who the primary user is; where and when the app is used; the user's relevant abilities, limitations or expectations.

Primary user: Junior university history students.

Where and when the app is used: The app is used for general historical exploration. It may be used on campus, at home, or while reviewing course materials on an iPhone.

Relevant abilities, limitations, or expectations: Users are expected to have basic familiarity with historical figures, periods, or events, but may have difficulty recognising chronological relationships between people from different regions. Users expect clear navigation, readable historical information, reliable data, and an easy way to understand lifespan overlap without manually comparing dates.

Primary features breakdown — the main features of the app, including where it begins, the key decisions, and the information exchanged between the user and the system.

Main feature: Discovering historical contemporaries through an interactive lifespan timeline.

Where it begins: The user begins by searching for a historical figure by name and selecting the correct person from the search results.

Key decisions: The user chooses which historical figure to explore, which contemporaries to view, whether to filter results by region or category, and whether to compare or save selected figures for later study.

Information exchanged between the user and the system: The user provides a search term, selects historical figures, applies filters, and interacts with the timeline. The system retrieves historical data such as names, birth dates, death dates, descriptions, regions, and available portraits, then identifies overlapping lifespans and presents relevant contemporaries visually. The system may also save selected figures or collections for later use.

GitHub Repository URL

https://github.com/rmit-iPSE-s2-2026/a1-s4084278

Miro Board URL

Paste the URL of shared Miro Board, kindly make sure it is shared with shekhar.kalra@rmit.edu.au

Part A & B remaining tasks

What went into SwiftData (*stored locally*) and into Firebase or an approved Cloud database (*stored in a cloud database*)?

b SwiftData and Cloud Database

In SwiftData, we have decided to cache historical figure data locally for fast UI state. The cached data includes default historical figures shown on homepage, recently viewed figures, and previously retrieved biographical information.

In Firebase, we store users' bookmarked historical figures. Firebase provides persistent cloud storage for user-specific information and that's why we store user-managed bookmark data here.

c. URL of the REST API used in our app

Type the URL of public REST API used for the app

https://www.wikidata.org/wiki/Wikidata:Main_Page

f. List of Accessibility features implemented in our app

1. **Dynamic Type Support:** We implemented scalable text with semantic font styles like .headline, .caption, .body, etc. The scalable text can adapt to the user's preferred system font size.
2. **Adaptive Layouts:** We added responsive grid layouts. If users preferred larger accessibility text sizes, the two column layout will become one column to display full text and prevent text truncation.
3. **VoiceOver Support:** We added descriptive accessibility labels, hints, and values to interactive elements.
4. **Improved Colour Contrast:** We adjusted text and background colours to improve readability and meet accessibility inspector's standard.
5. **Accessible Navigation:** We used SwiftUI's standard navigation components with added accessibility heading traits to improve navigation for assistive technology users.
6. **Accessibility Testing:** We conducted audits using Xcode's Accessibility Inspector. We manually tested the app at different dynamic type sizes to fix accessibility issues.

i Which AI agent did we use and why?

N/A

j Which 'Moment to Shine' feature did we implement, and why?

N/A

Finally, please fill the Group Contribution Form →

IMPORTANT — HOW CONTRIBUTION PERCENTAGES WORK

50% + 50% = equal contribution. No contribution-based mark adjustment is requested.
Any other split = unequal contribution. For example, 60% + 40% reports that one member contributed less.
A lower percentage may reduce an individual mark. The teaching team reviews the form and evidence before deciding any adjustment.
Percentages are not marks. A 40% contribution does not mean a mark of 40/100.

STEP 1 Select one option *Place an X in one box*

☒ **OPTION 1 — Equal contribution.** We agree that both members made a significant and broadly equal contribution. Record 50% for each member below.

☐ **OPTION 2 — Unequal contribution.** We report different contribution shares. Enter the agreed percentages below and provide specific evidence on page 2.

STEP 2 Record each member's contribution *Total must equal 100%.*

Student number	Student name	Contribution %	Agrees with %? Yes / No
s4084278	Nina Chen	50%	Yes.
s4015017	Hengly Lim	*50%*	Yes.
	TOTAL	*100%*	

STEP 3 Provide evidence ONLY in case of UNEQUAL contributions

Summarise what each member completed and cite evidence such as GitHub history, Miro activity, meeting notes, prototypes, files, or an agreed task list. Consider quality, effort, responsibility, communication, and meeting deadlines—not task count alone.

Student	Main contributions and responsibilities	Evidence / link / file reference
Student 1	*Describe completed tasks, decisions, quality, effort, communication and deadlines.*	*List specific evidence or paste links.*
Student 2	*Describe completed tasks, decisions, quality, effort, communication and deadlines.*	*List specific evidence or paste links.*

STEP 4 Confirm agreement and sign

☒ **WE AGREE** with the percentages and evidence above.

☐ **WE DO NOT AGREE**. Explain the disagreement below; the teaching team may contact both students before deciding any adjustment.

Disagreement explanation (if applicable): *Click or tap here to enter text.*

Declaration. We confirm that the information in this form is accurate to the best of our knowledge and that both students have seen the completed form. Signatures confirm that the form has been reviewed; you may still record disagreement above. The teaching team makes the final decision on any individual mark adjustment.

Student	Signature	Date
Nina Chen	*Nina Chen*	*11 / 10 / 2026*
Hengly Lim	*Hengly Lim*	*11 / 10 / 2026*

If both students cannot sign, this form will be null and void, and percentage contributions cannot be applied to calculate the final score.
